Subject: CES (A6KC) Air Sampling (Summa) On-Site and in Residential Areas

Date: Monday, August 11, 2014 4:08:00 PM

Attachments: <u>Air Data Summary.xlsx</u>

EPA AIR 1408079 d.pdf

Hello:

Attached is the lab data for the Summa cans pulled at the site and in the residential area. Please take a look at the summary and the lab data and give me comments. I put the table together so there may be some errors so please check. Also, are there any other comparison data that we should be looking at?

At the bottom of the air data summary it shows the air sampling locations. If you need a map, I can put one together.

CES-CS-Summa-01 – Spill path from site to

Kingsbury (drainage path off the site)

CES-CS-Summa-02 – South of Kingsbury (across

street from drainage path off the site)

CES-CS-Summa-03 – Onsite by gate we repaired

(closer to vacuum boxes)

CES-CS-Summa-04 – Onsite between the north

and south tank batteries

I only had hits above the residential levels was a TIC of 2 methyl-1,3-butidiene. I also had some hits about the residential standard on the site of several compounds but those should probably be evaluated against the industrial standard.

Let me know if I made any errors or missed anything.

Thanks

Gary Moore
